

System and Line Information

The C183 Transportation Planning Task Force has planned and constructed a new form of transport: *The Print Line*.

Along your route, you'll explore the mathematical intricacies of **Projection**, the messy and ambiguous nature of **Data**, and the aesthetic satisfaction of bringing the landscape into a cohesive narrative through **Design**.

Use the map key on the right to identify the questions and themes your group will be asking at each stop.

Bahn Stop

Print Line

Foundations Exit

Experimental Exit

Projection Strasse

At this stop, we exited and learned how a map is transformed from a real, breathing lifeform (*Geoid*) into a 2-D/3-D representational surface for us to interpret.

This transformation is produced by the relationship between a **Datum**, **Geographic Coordinate System (GCS)**, **Projected Coordinate System (PCS)** and the **Projection**.

We always need to know how the GIS is reading our data's ability to be located on the GCS, and its ability to be projected onto the cartographic image.

Projection Strasse

Where does this projection system emerge from?

How do the elements of the projection influence the conversation we can have about the map?

What features of the landscape are emphasized and which are not? Why?

If the existing projections do not appropriately represent the landscape, can you make your own?

Data Acquisition Strasse

Process the data using the **correct GCS/PCS system** identified in the feature/geodata properties.

Notice which **organizations curate and collect** geospatial data, what **scale** its collected at, and any information on the **feature/geodata characteristics** in their metadata.

Identify the forms of **enumeration**, **normalization** and **classification** in the dataset.

Ensure the **geometry** of the **feature layer** appropriately matches is geographic element and scale

Identify a geometry to match with **non-geospatial data**

Data Acquisition Strasse

Continuing to practice the **art of choosing objects of study**, and beginning to struggle with masters of the craft.

Excavate how the cartographer is constructing their world (**basemap**) through forms of spatial language (**classification**) to argue for a different way of seeing (**semiotics, signs**)

Think through the **possibilities and limitations** of their **data sources**, are these sources appropriate for the space narrated in the map?

How can you create **new forms of knowledge** by **manipulating the data**?

Basemap Strasse

Emphasis on stylizing feature layer elements given the **nature of the GIS data attributes**, and the **landscape form it is representing**.

Produce styles that differentiate between **Primary Data** and **Secondary Data** on the basemap.

Keep your **audience** in mind, are they able to **make decisions** and **create conversation** based on how you stylize the map?

Basemap Strasse

Pay attention to how the workflows and decisions between building a **dataset for a basemap**, and building a **dataset for analysis** are different. And yet complement each other in the final cartographic image.

Notice how the **production of data classification** comes to influence **moments of ambiguity** when thinking through design choices.

Think of strategies for how you can let your story **re-structure the basemap** as opposed to letting the basemap control the story.
